

Semen Result Review – Kindbody Dataset -

Jason Agyemang

August 2022

Objectives

Goal: Analyze Semen Parameters of Patients and their propensity to seek treatment

Approach: Compare Total Motile Count (TMC) and semen diagnosis results to each patient's treatment status

- Treatment Status: Sought treatment, did not seek treatment
- Utilized the 2021 Kindbody patient data
- Dataset included 408 patients
- As reference: The Total Motile Count(TMC) indicates the total number of swimming sperm in the ejaculate. A higher TMC equates to a better chance of a couple achieving pregnancy

TMC Category Definitions

4 TMC bins associated with paths to conception were utilized to categorize and class the results

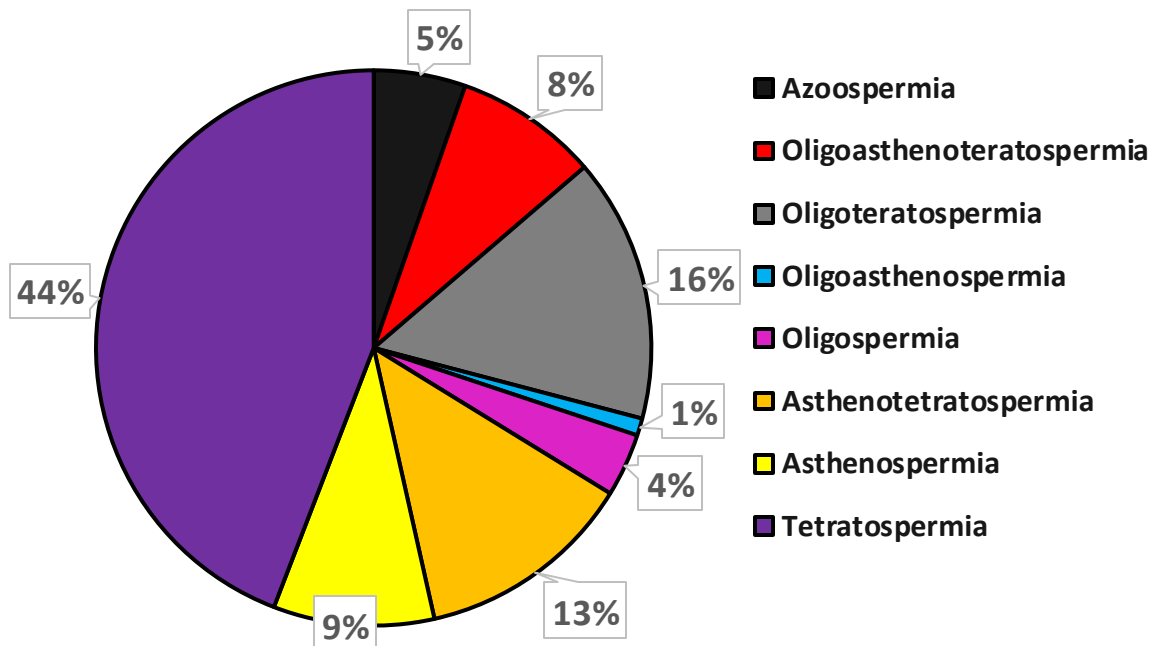

Sperm Diagnosis

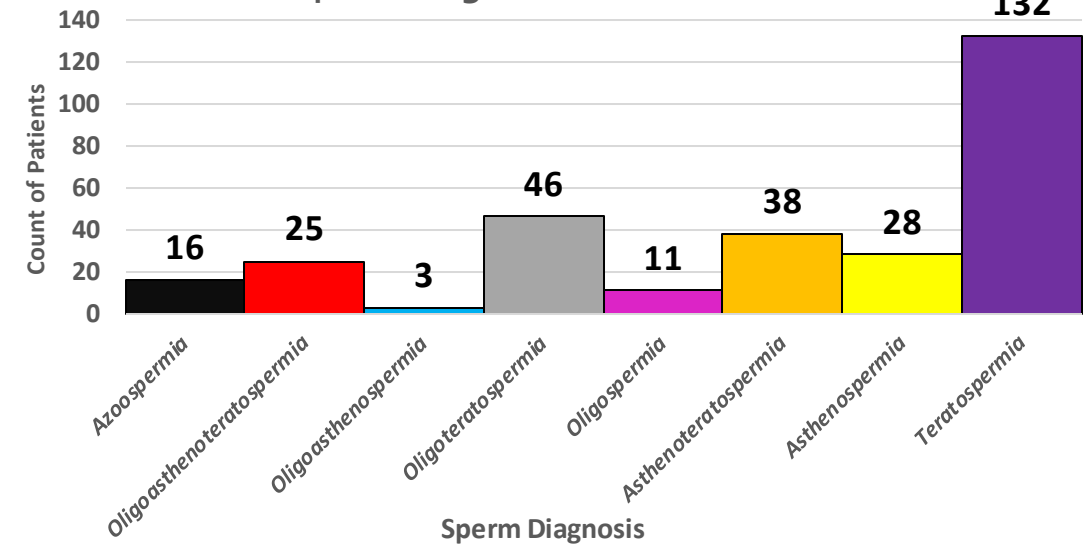

Results are	Diagnosis	Concentration (oligo)	Motility (astheno)	Morphology (terato)
normal	normospermia	≥15mil/mL	≥40%	≥4%
abnormal	azoospermia	0 mil/mL		
abnormal	oligospermia	<15 mil/ml	≥40%	≥4%
abnormal	oligoasthenospermia	<15mil/ml	<40%	≥4%
abnormal	oligoteratospermia	<15mil/ml	≥40%	<4%
abnormal	oligoasthenoteratospermia	<15mil/ml	<40%	<4%
abnormal	asthenospermia	≥15mil/ml	<40%	≥4%
abnormal	asthenoteratospermia	≥15mil/ml	<40%	<4%
abnormal	teratospermia	≥15mil/ml	≥40%	<4%

Patient Population with Abnormal Parameters (n=299)

Sperm Diagnosis of KB Patients

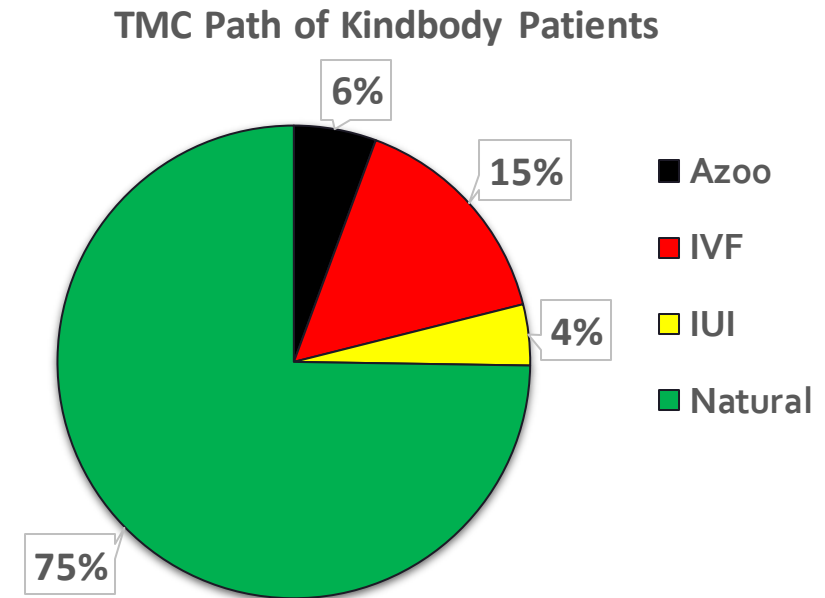

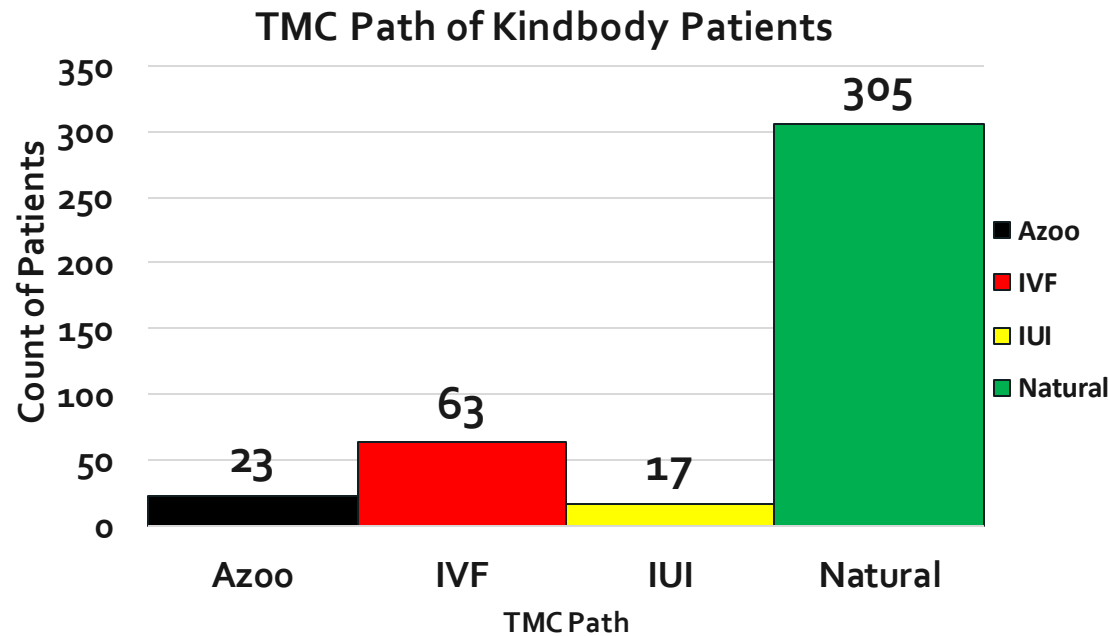

Sperm Diagnosis of KB Patients

Teratospermia (Morphology) was the most prominent abnormality

Patient Population by TMC Category

75% of the patient population with abnormal semen parameters had a TMC generally considered sufficient for natural conception

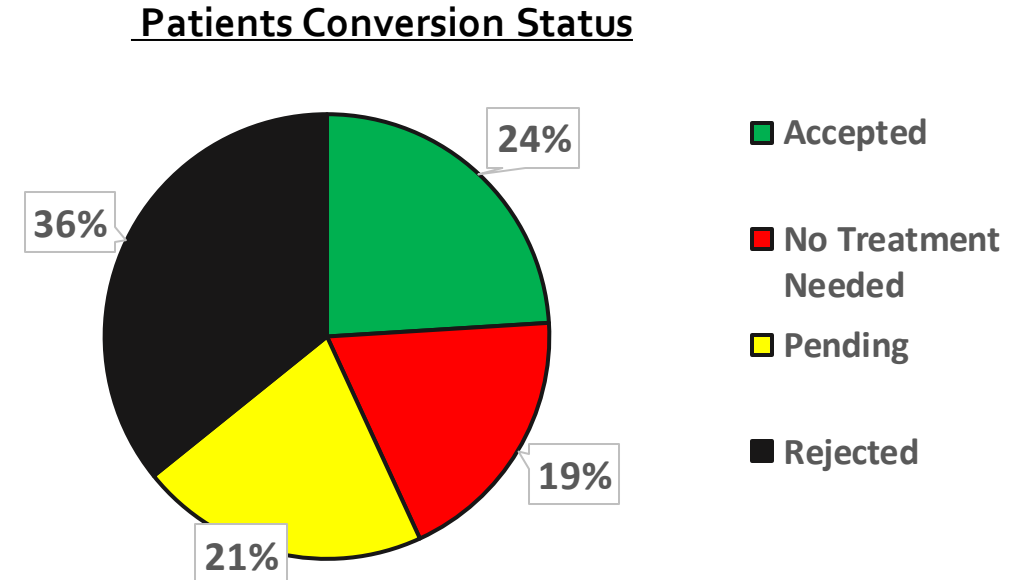

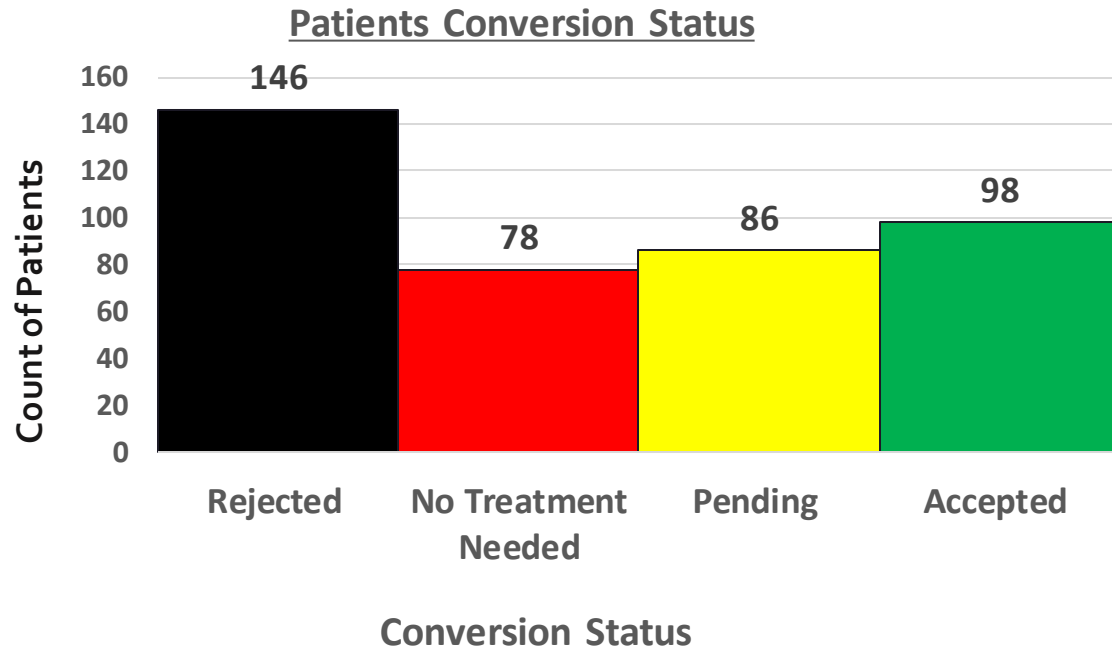

Patient Population with TMC >15mil and Abnormal Parameters

DIAGNOSIS BREAKDOWN FOR PATIENTS CONSIDERED TO HAVE
TMC SUFFICIENT FOR NATURAL CONCEPTION (N=232)

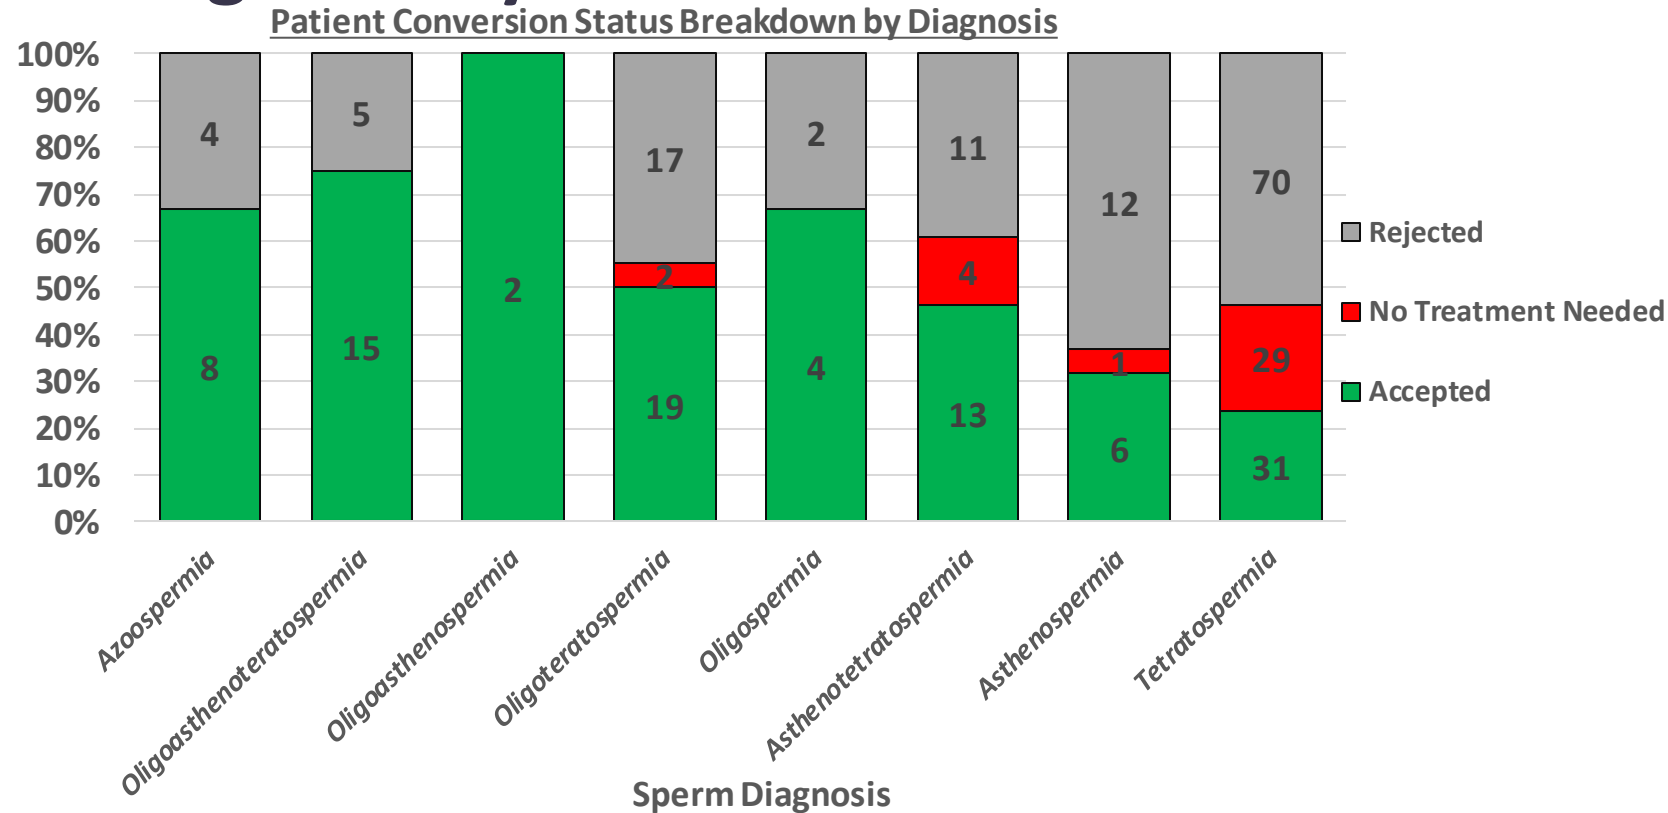

There is a large population with abnormal morphology (terato) that are generally overlooked as having sufficient counts for natural conception

Patient Population by Conversion Status

Patients Diagnosis by Conversion Status

As expected, acceptance rates are higher from the Azoo and Oligo populations. Surprisingly about 2/3rds of Astheno and Terato patients advised to get evaluated did not
